

Robyn Wilson: Climate Change in the Eastern Corn Belt Region

3:30 PM September 25, 2020

Climate change in the eastern Corn Belt Region (ECBR) is projected to bring higher temperatures, more variable and extreme levels of precipitation, and longer growing seasons. While these possibilities imply opportunity for increased production, managing change sustainably will be increasingly challenging. The most concerning climate impact was more frequent extreme rainfall events. Farmer overall concern and interest in making adaptations was low (28%); however, interest in making adaptations increased as the likelihood of experiencing impacts increased. The implications of this study for policy will be discussed.
