GEOG 5222: GIS Programming and Algorithms

The Ohio State University
Autumn 2017

Time: Monday and Wednesday, 9:35 - 10:55 AM
Location: 0135 Derby Hall
Course URL: http://carmen.osu.edu

Instructor: Professor Ningchuan Xiao
Office: 1132 Derby Hall
Phone: 292-4072
E-mail: xiao.37@osu.edu
Office Hours: Monday 11 AM - 12 PM or by appointment

TA: Mr. Jialin Li
Office: 1131 Derby Hall
Phone: 614-680-2653
Email: li.7957@buckeyemail.osu.edu
Office hours: Wednesday 8:00-9:30 AM and Friday 4:00-5:30 PM, or by appointment

This class is about coding. More specifically we develop skills to program a computer to do spatial data handling. It is obvious, one may argue, that many of today's software packages are quite easy to use and they are quite powerful. So why should we code? In a 1984 New York Times article, Erik Sandberg-Diment gave three reasons: "First, it allows you to develop software that is not available commercially, and in some cases it lets you customize purchased software to serve your specific needs better. Second, programming can be fun. If you enjoy working on puzzles, programming may well turn out to be more pleasurable than solving The Times crossword puzzle or Dr. Crypton's mind-bending puzzle page in Science Digest. Third, there is the intellectual exercise, the honing of logic skills and learning to learn, stressed by pedagogues as a perfect reason to have computers available in schools for pupils from kindergarten age on up." In a blog at Invent with Python, Al Sweigart pointed out that "Programming transforms your computer from a home appliance to a power tool." It is apparent that writing computer code is becoming an essential part of life. As Steve Jobs once put it, "everybody in this country should learn to program a computer...because it teaches you how to think."

In this class, we aim to help students gain freedom in dealing with spatial data. To put it more plainly, it is my hope that students will understand how spatial data works and how to write their own code to handle the data, instead of relying on existing (especially commercial) software packages. We use the powerful and popular Python programming language in this class. We start from scratch by learning the basics of Python. Before the mid-semester, we should have developed sufficient knowledge about programming with Python and we will start to use Python to handle spatial data. Most of the materials do not rely on existing software packages (in other words, we use pure Python), which will provide an intuitive way of understanding spatial data and spatial data processing. By the end of the semester, students should understand the fundamental considerations of computation issues in spatial data processing and should be able to write Python code to complete various tasks of using spatial data.

Textbooks

We use two required textbooks for this class:

Allen B. Downey. 2016. **Think Python**. 2nd Edition. O'Reilly Media.
Ningchuan Xiao. 2016. **GIS Algorithms**. SAGE Publications.

Also, a Github site called gisalgs will be used intensively for most part of the class.

Lecture notes will be made available through the course schedule page. These notes are HTML files made as jupyter notebooks with iPython.

There are a lot of useful online sources for learning Python. For example, The Hitchhiker's Guide to Python! has

information that can be extremely practical for many beginners. The official Python Tutorial is a good place to find the details of most of the topics in Python coding (make sure to choose the right version on top of the page).

Credit Hours

This is a 3 credit hour class.

Evaluation

The following is a breakdown of the components that will be used to evaluate student performance in this class. At the end of the semester, the percentage of each component will be used to convert to a total of up to 100 points. Standard OSU grading scheme will then be used to determine the final letter grade.

1. **Participation (20%)**. At the end of each lecture, there will be some review exercises that typically require students to finish by the end of the next day. These exercises may be only handed out to students who attend the class. Students who receive an A in this category will get a bonus of a half letter grade that will be added to the final grade.
2. **Homework (20%)**. Before the end of each major topic, there is a homework assignment that includes some more in-depth questions for students to finish. There are a total of 3 homework assignments.
3. **Quizzes (30%)**. A quiz will be given after we finish a major topic. Three quizzes are scheduled for this course. These are open-book quizzes that will require students use the computer to answer. All the quizzes are equally weighted.
4. **Final project (15%)**. I will provide a list of guided questions and each student will choose to answer one of these questions. The questions will be based on the topics covered in the semester. Only sufficient information will be provided, which means I will not provide all the implementation details for the questions and students must find solutions by themselves. There will be open questions that give students a lot of freedom to complete the project. The open questions will require a short proposal from the students.
5. **Final exam (15%)**. This will cover all the topics of this course.

Important Class Policies

- Individual work. Collaboration is healthy and often necessary, but each student should definitely finish the work individually. Please see below for more information about academic misconduct.
- Deliverables. All deliverables must be submitted as specified in the homework/project instructions. There will be absolutely no email submissions.
- Late submission. I will not give makeup quizzes or accept late submissions unless a good reason is presented prior to the due date. Submissions two weeks after the due date will no longer be accepted, unless permission is granted before the due date.

Schedule

The course is divided into a few major topics:

Weeks 1-6: Python programming language
Weeks 7-9: Geometric algorithms
Weeks 10-14: Spatial indexing
Weeks 15-16: Spatial analysis

The detailed schedule can be found at the course schedule page on Carmen. Students should check this page frequently as it will be updated whenever new materials are made available.

Student with Disabilities

The University strives to make all learning experiences as accessible as possible. If you anticipate or experience academic barriers based on your disability (including mental health, chronic or temporary medical conditions), please let me know immediately so that we can privately discuss options. You are also welcome to register with Student Life Disability Services to establish reasonable accommodations. After registration, make arrangements with me as soon as possible to discuss your accommodations so that they may be implemented in a timely fashion. SLDS contact information: slds@osu.edu; 614-292-3307; slds.osu.edu; 098 Baker Hall, 113 W. 12th Avenue.

Policy on Plagiarism and Academic Misconduct

If I suspect that a student has committed academic misconduct in this course, I am obligated by University Rules to report my suspicions to the Committee on Academic Misconduct. The term "academic misconduct" includes all forms of student academic misconduct wherever committed; illustrated by, but not limited to, cases of plagiarism and dishonest practices in connection with examinations. It is the responsibility of the Committee on Academic Misconduct to investigate or establish procedures for the investigation of all reported cases of student academic misconduct. Instructors shall report all instances of alleged academic misconduct to the committee (Faculty Rule 3335-5-487). For additional information, see the Code of Student Conduct at http://studentlife.osu.edu/csc/.
